

Brainstorm

◇ LOCAL-FIRST · AI-NATIVE

A desktop OS for you and your AI.

Brainstorm runs your apps, your data, and your AI on your own machine. Install what you need, keep every file on your disk, and let AI help — only with the parts you hand it.

Pre-Seed · Bridge to launch

Local-first

No account

End-to-end encrypted

Made in EU

Your work is scattered, rented, and unsafe for AI.

Every team runs on a dozen disconnected SaaS tools — Notion, Docs, Slack, email, drives. They don't talk to each other, and they share the same three flaws.

- ◆ **Data held hostage.** Proprietary cloud formats, weak export, permanent vendor lock-in. You rent your own knowledge.
- ◆ **A privacy and compliance liability.** It bites under GDPR and the EU AI Act — and only gets worse once company IP starts flowing into someone else's cloud.
- ◆ **AI bolted on, not built in.** A button in someone else's cloud, working on data you don't own, with no record of what it did. An assistant is only as good as the data it can safely reach.

One OS. Your apps, your data, your AI.

Brainstorm is a desktop shell that runs sandboxed apps over one structured, encrypted object space that lives on your machine. The same permissions that govern an app govern an agent.

Apps, not features

The shell only hosts apps — Notes, Database, Files, Graph, Calendar, a code editor. Add the ones you want, drop the rest, all built on the Block Protocol so content stays typed and portable.

Your data, your disk

Every document is a plain file in a folder you own, encrypted with a key only you hold. Sync is optional and end-to-end encrypted — the relay only ever sees scrambled bytes. No account to sign up for.

AI you can govern

The shell sits between your apps and any AI. Use your own API key or a local model, and decide exactly what each app and agent is allowed to touch — every grant specific, logged, and revocable.

An operating system, not another app.

- ◆ **Twenty sandboxed apps** — notes, tasks, databases, calendar, mail, browser, whiteboard, graph & more, isolated for security.
- ◆ **A capability ledger & IPC broker** — every access by an app *or an agent* is permission-checked, logged, and fails closed.
- ◆ **CRDT sync (Yjs)** — real-time, offline-first collaboration through a relay that never sees your content in the clear.
- ◆ **An SDK & app ecosystem** — third parties build on the same shared object space.

APPS · SANDBOXED

Notes Tasks Database Calendar Mail Browser
Whiteboard Graph +more

SHELL · BROKER & CAPABILITY LEDGER

Identity, permissions, window & app registry. Governs apps and agents alike. Fail-closed.

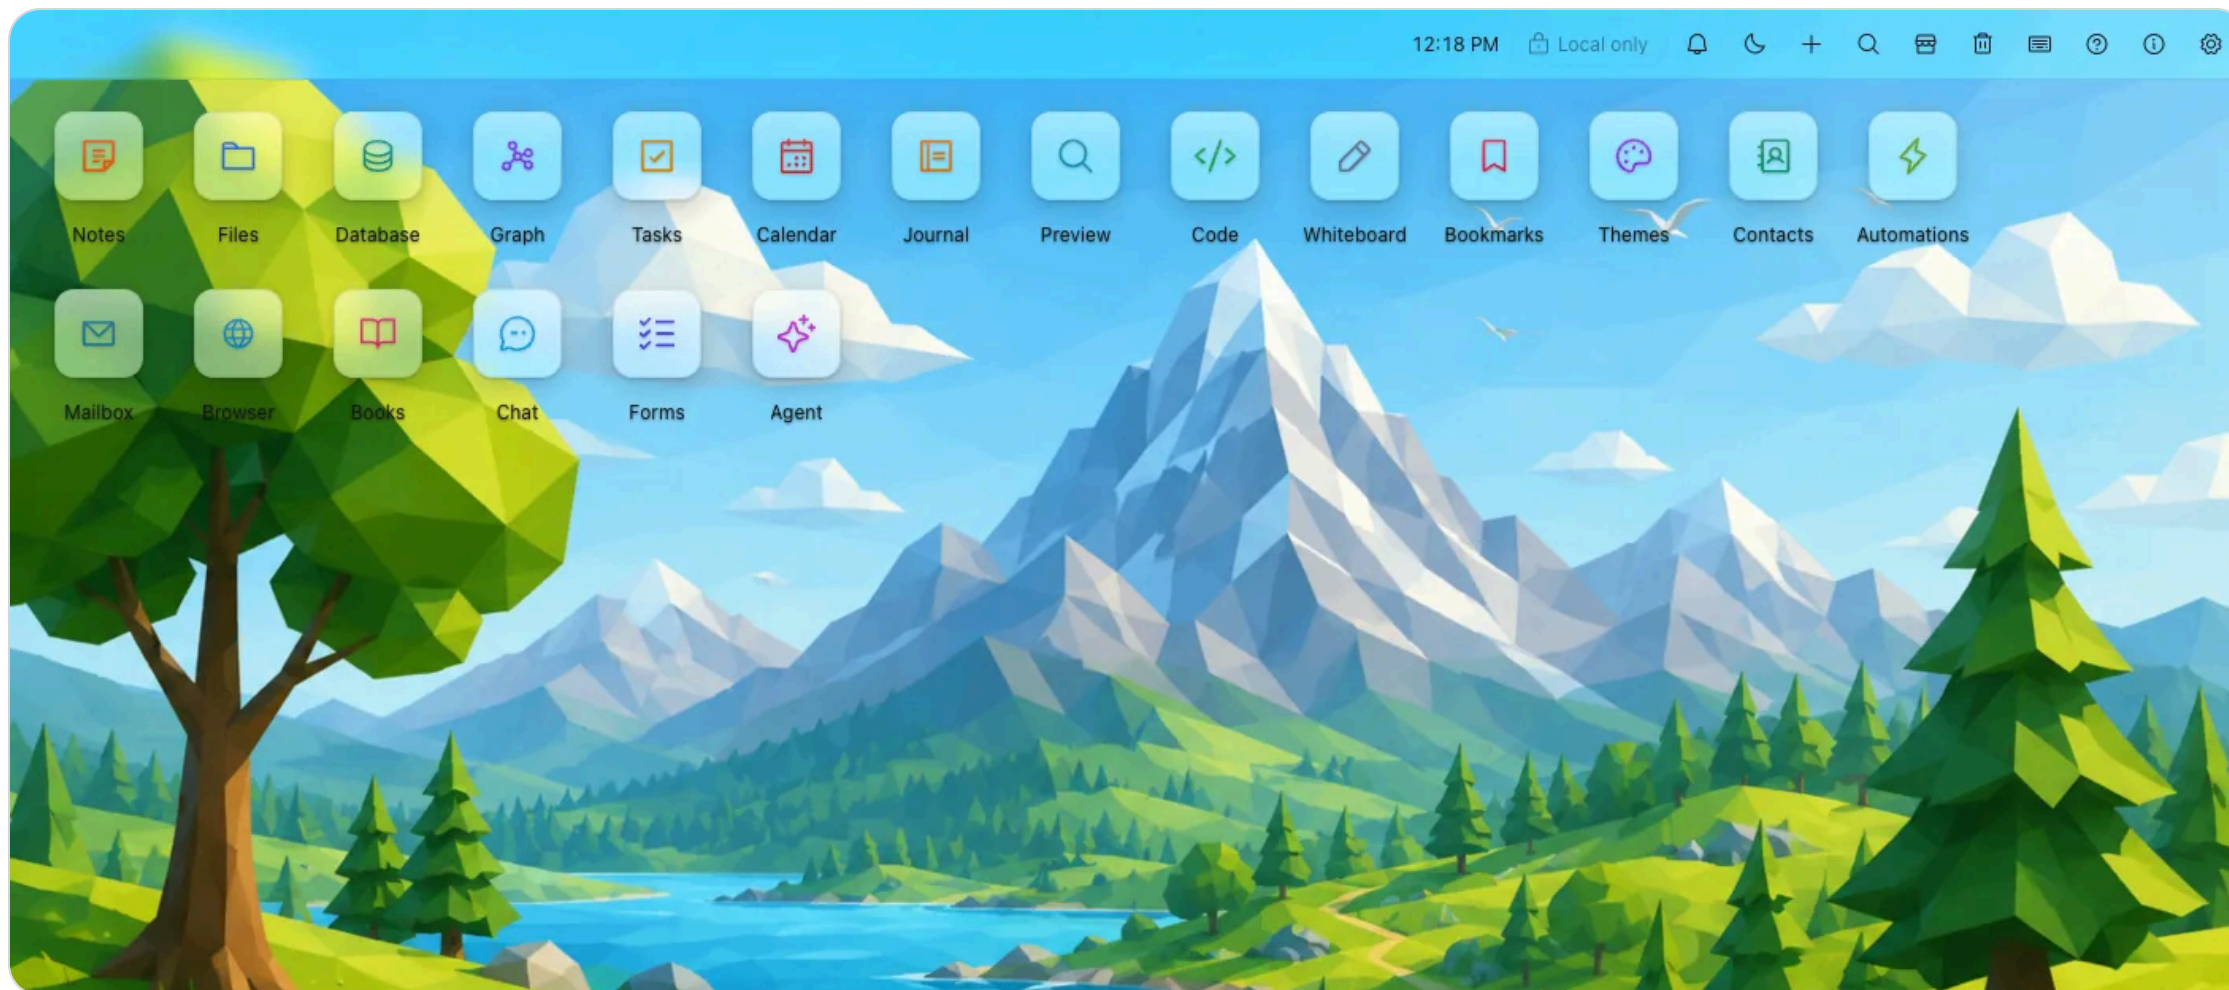

AI BROKER

Your key or a local model · per-app budgets · provenance on every object.

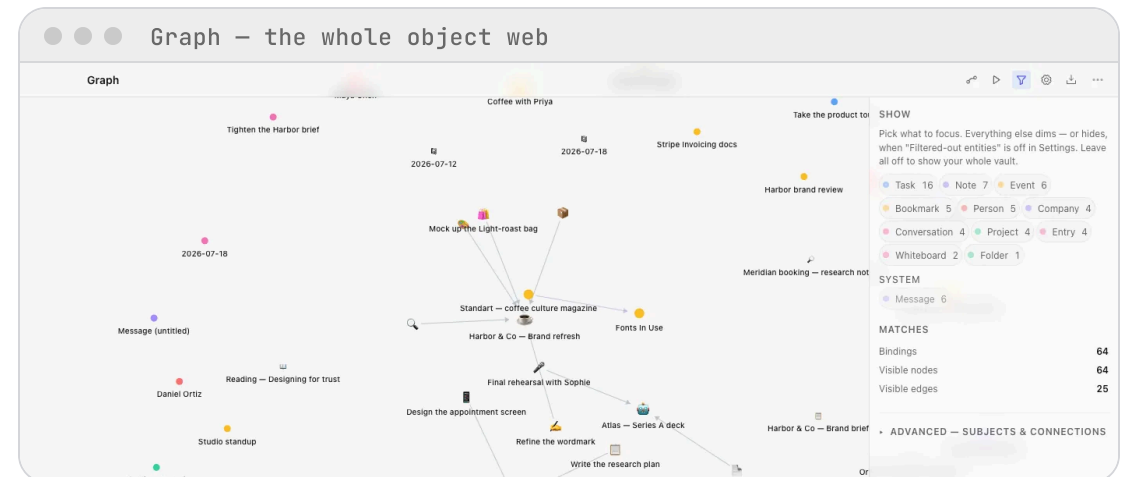

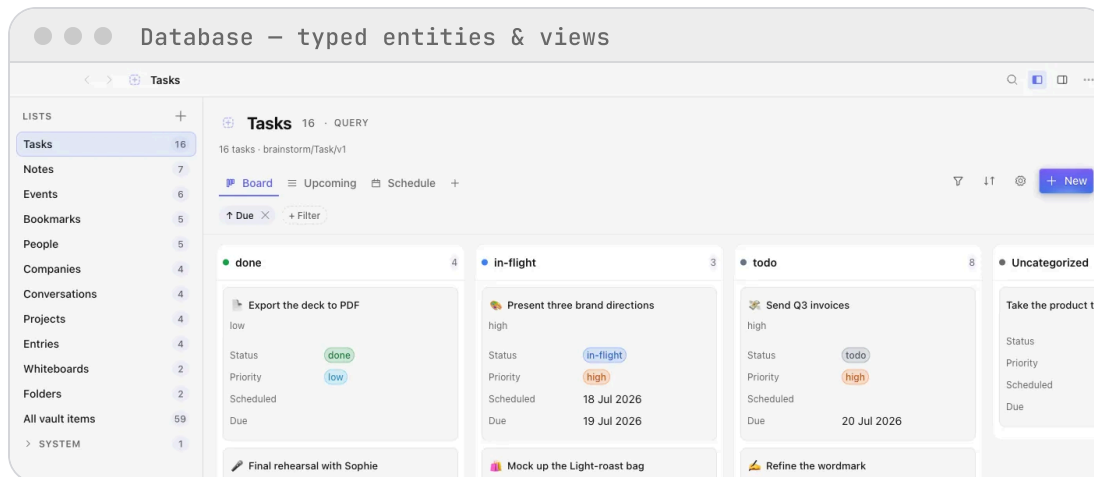

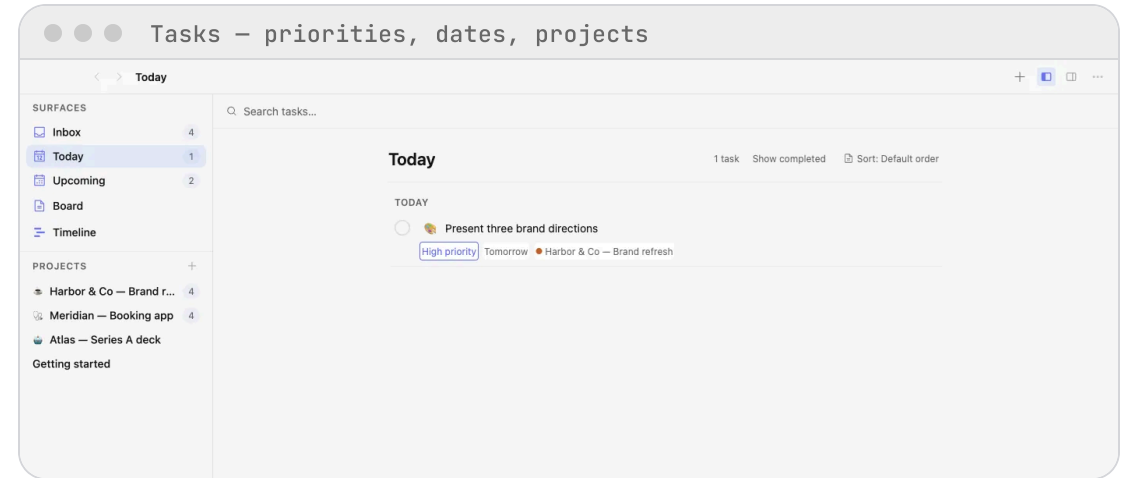

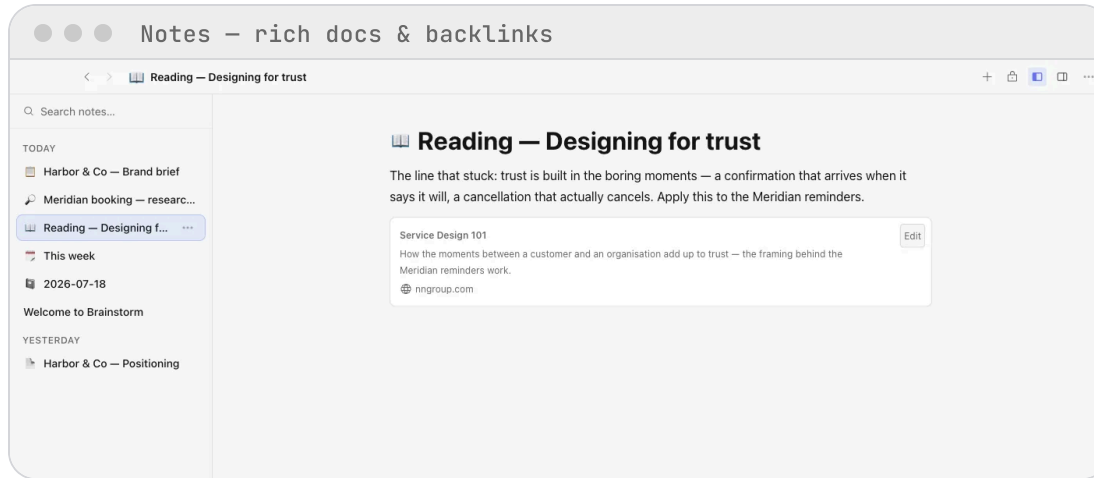

ENCRYPTED VAULT · BLOCK PROTOCOL + YJS

One typed, portable, CRDT-synced object space — on your disk.

A real, shipping desktop OS.

One set of objects. A different app for each way of seeing it.

Three curves are crossing.

01

AI raises the stakes

An assistant is only as good as the data it can see. A single, well-structured personal object space is suddenly worth far more — and right now almost nobody has one.

02

Sovereignty tailwind

GDPR, the EU AI Act and plain IP worry are turning **local-first, encrypted, EU-hosted AI** into something buyers now ask for by name. A natural fit for a European company.

03

The pieces are ready

CRDTs, local SQLite, on-device-capable models and the Block Protocol have only recently become good enough to ship together.

A large, fast-growing wedge.

We start with privacy-conscious knowledge workers and teams, then expand into the wider collaboration and personal-AI markets.

TAM · KM & collaboration

Global productivity / collaboration software — tens of \$B, double-digit CAGR.

SAM · Privacy-first & AI tools

Notion / Obsidian / personal-AI adjacent segment, EU + global.

**SOM · DACH/EU
sovereignty**

Beachhead: regulated, privacy-sensitive teams & prosumers.

Figures to be finalised with sourced market sizing (deep-research pass available on request).

Freemium → subscription → AI usage.

A free local-first core brings people in — no account required — the way Obsidian and Notion grew. We charge for sync, collaboration and managed AI.

Free

€0

Local-first core, full data ownership, free forever. This is what gets people in.

Pro

SUBSCRIPTION

Encrypted sync, more AI budget, advanced apps for prosumers.

Team

PER SEAT

Real-time collaboration, shared vaults, admin & governance.

AI usage

METERED

Managed access to premium & sovereign models, transparent per-feature budgets.

Billing and metering run in a separate system that **never touches vault content**, so the privacy promise holds even as we charge. Enterprise and self-hosted plans, plus a third-party app store, are where it grows from there.

Hard to copy, harder to retrofit.

Built into the architecture

Sandboxed apps and governed agents over one encrypted object space isn't something you bolt onto a cloud SaaS. To match it, an incumbent would have to rebuild its core.

Ecosystem flywheel

A public SDK and Block Protocol support let anyone build apps on the same data. Every new app makes the rest more useful.

Trust we can't fake

"We *cannot* read your data" — and a ledger that records what every agent did — is a promise Notion and Google can't make. For us it's the whole foundation.

Where we stand alone.

CAPABILITY	NOTION	OBSIDIAN	GOOGLE WORKSPACE	BRAINSTORM
Local-first & offline	—	✓	—	✓
End-to-end encrypted	—	partial	—	✓
Interoperable data layer	—	files	—	✓ Block Protocol
Governed agents over your data	limited	plugins	limited	✓ capability ledger
App platform / SDK over one graph	—	plugins	—	✓

Shipping every few days, in public.

20

first-party apps on a unified shell

31

releases since the public beta

E2E

encrypted vaults, media & credentials

Any

model — your API key or a local one

SHIPPED

Shell & twenty apps

Sandboxed host, capability ledger, vault — apps sharing one object space.

SHIPPED

The AI broker

One path for every AI call — provenance on every object, budget on every app.

SHIPPED

Agents as vault members

An agent holds permissions from the same list a person holds, proposes changes you approve, and logs every run, tool call and refusal.

LIVE NOW

Apps that call each other

Every installed app is a typed tool provider — one registry feeding object menus, the editor, automations and the agent. Sharing by name ships alongside it.

NEXT

Sync across your devices, and a hosted marketplace

The store is built and unhosted; multi-device sync is built and not yet proven between two machines. Both are tracked in the open.

The public beta shipped nine weeks ahead of the 1 September target and has had **31 releases since**, each delivered to existing installs as an in-app update. The roadmap is **public**, including what has not been built — multi-device sync is on it as unfinished, because it is. User and revenue numbers are only starting to accrue; the signal today is shipping velocity and candour.

Seven years on exactly this problem.

I've spent seven years building decentralized, end-to-end-encrypted, offline-first knowledge tools, full-stack. Brainstorm is that work, turned into a product.

- ◆ **Built it end to end** — the full-stack app and its analytics.
- ◆ **Already shipping** — a working, security-audited product, not a slide deck.
- ◆ **This is home ground** — encryption, offline-first sync and data ownership are what I've worked on for years.

A track record in this space

Years of hands-on experience building decentralized, encrypted, offline-first tools — turned into a working product.

First hires with this round

Growth / BizDev

Full-stack engineer

Design / DevRel

€150k pre-seed on a SAFE — stacked on grants.

The product is live. We fund the launch push as a capital stack: a non-dilutive EU/Berlin grant base carries the R&D, and a small SAFE on top buys speed — so angel capital goes to runway, not overhead.

Launch & marketing

The launch push: content, community, paid acquisition and a clear privacy-first message — what grants won't fund.

AI & infrastructure

Model-usage costs as users grow, plus hosting for sync, the AI broker and the control plane.

First hires & BizDev

The first Growth, full-stack and DevRel hires, partnerships and the B2B/team pipeline.

~€150k pre-seed on a SAFE (~7% at a ~€2M cap; checks taken as they close) sits on top of a **non-dilutive grant base** — IBB Pro FIT, EXIST-track, GRW and EIC deep-tech programs, in active pursuit — that funds R&D without touching the cap table. This carries us through the launch window and the first hires; the priced seed comes next, on real activation and retention data, at a materially better valuation.

Brainstorm

◇ OWN YOUR TOOLS AGAIN

Deep tech. Local-first to the core. A real platform.

This is the kind of deep-tech, IP-heavy company investors back early, with a clear path from individual users to teams and businesses.
